ABSTRACT

Today whole internet user community moving towards online stuffs. One of the most important online applications today is undoubtedly online booking applications. Travel portal is a online booking engine for all users itinerary such as bus booking, hotel booking, route planning, etc. providing the new and state-of-art features in the travel portal is more demanding as the existing system already have. The ongoing travel portal application development should provide the facility to users like search the service, book the service, planning their journey, travel information, destination information, advance search, etc.

Using web services make the booking engine administrator very easy to integrate the database from the several isolated suppliers. SOAP is a web service protocol which is based on XML file which is platform independent format makes interoperability seamlessly. The SMS functionality is became necessity of the present working style, that every user wants quick information update. Mobile device is the most consumable device now a day, almost every people having it. So providing the service on mobile is one of the desire service for the users. Language translation may be good option for multilingual users. Google proving the web services for language translation as client side API. At present only Hindi language translation is possible in Indian language. Apart from this other foreign language translation is possible.
