

Abstract

In the organization side there is an interface where an employee from the organization can register their different customer's data without any ambiguity. The customer's information will be stored in a database. Based on that data the employee can request for different bills to be pay by the customer to the bank. At the time when the employee gets logged in to the system his information such as name login date, time will be keep recorded. After the request is send to the bank's side software the customer's data will be updated for a specified period.
