

## ABSTRACT

Web sites are a critical part of business and the production of complicated Web applications that require more than the standard methods of interaction (such as blogs) are not trivial. Often, each application within an organization requires customization which requires web expertise. But people maintaining a site may not have proper web skills. Here comes the role of a content management system. A Content Management System (CMS) supports the creation, management, distribution and publishing of corporate information without having much technical and web skills.

We choose Drupal as the content management system for developing the proposed CMS. Our system allows users to register for different courses. Here the users are differentiated based on their roles. Any user, who wants to register, needs to send his details to the administrator who will create an account for that user and send his username and password to the user's account. Here an Organic Group module is being used which helps the users to create different groups.
