

ABSTRACT

The aim of the project entitled "Tezpur University Admission Management System" is to develop a web based application for Admission Management System of Tezpur University. In Tezpur University, on the day of admission each candidate passes through several stages of the admission process. It starts with reporting at the admission venue, waiting for call, filling up of forms, verification of documents and allotment of seat in the programme, hostel admission, fees deposit etc. Admission to several programmes are conducted simultaneously in the same venue. Some of the stages of admission are executed serially and some others are done in parallel. In the present system it is difficult to keep track the status of the candidates in the process as the number of student is high. In this project we computerize this part of admission management system, so that it is easy to keep track the status of candidates on the day of admission.
