List of Tables

Chapter	Table	Title	Page no.
Chapter II			
	2.1	Properties of Tb^{3+} doped Gd_2O_3 nanocrystalline phosphors	37
	2.2	Decay time constants calculated from TR-PL spectra	41
	2.3	Average crystallite size (nm), lattice parameter (nm), microstrain and dimension of nanorods (nm) of as-synthesized Gd_2O_3 nanorod systems	44
	2.4	Physical characteristics estimated from XRD data	55
Chapter III			
	3.1	Electronic energy loss (S_e), nuclear energy loss (S_n) and the projected range (R_p) of 80 MeV C^{6+} ions in different material systems.	72
	3.2	Energy deposition and structural parameters associated with the Gd_2O_3 nanorods subjected to 80 MeV C^{6+} ion irradiation (through XRD and TEM analyses)	72
	3.3	Characteristic parameters as predicted from the analysis of the EPR spectra	82
Chapter IV			
	4.1	Physical parameters derived through XRD analyses of Eu^{3+}:$Gd_4O_3F_6$ nanosystems	94
	4.2	Judd-Ofelt intensity parameters (Ω_2) and asymmetric parameters obtained from luminescence spectra	98
Chapter V			
	5.1	Physical parameters related to rheological studies of Gd_2O_3 nanorods based system.	111

List of Figures

Chapter	Figure no.	Caption	Page no.
Chapter I			
	1.1	Schematic diagrams of density of states vs. energy for *3D, 2D, 1D* and *0D* systems	2
	1.2	Part of the modern periodic table (lanthanide series)	4
	1.3	Phase diagram of rare earth sesquioxides (RE_2O_3)	4
	1.4	Different crystal structure of RE_2O_3: (a) hexagonal (b) monoclinic and (c) cubic	5
	1.5	(a) HRTEM image of Gd_2O_3 nanorods [41] (b) SEM image of Dy_2O_3 nanotubes [42] (c) SEM image of $Gd_2O(CO_3)_2 \cdot H_2O$ nanoflowers	7
	1.6	Structure of gadolinium oxyfluoride ($Gd_3O_4F_6$) (a) tetragonal [56] and (b) rhombohedral [57] forms.	8
	1.7	Electron microscopy images of different RE oxyfluorides (a) GOF nanospheres [44], (b) EuOF nanowires [47] and (c) GOF nanorods [56].	8
	1.8	Schematic of different events during ion matter interaction process	10
	1.9	Flow curves of Newtonian and non-Newtonian fluids [104]	15

Chapter II

2.1	Synthesis protocol for preparing Tb^{3+} doped Gd_2O_3 nanosystems	35
2.2	(a) A series of X-ray diffractograms of undoped and Tb^{3+} doped Gd_2O_3 (b) HRTEM micrograph of nanoscale Gd_2O_3 system	37
2.3	(a) Optical absorption spectra of undoped and Tb^{3+} doped Gd_2O_3 nanophosphors. Tauc plots of respective samples are shown in (b).	38
2.4	Room temperature photoluminescence spectra of the undoped and Tb^{3+} doped Gd_2O_3 nanophosphors (λ_{ex} = 300 nm)	40
2.5	TR-PL spectra of (a) 1% and (b) 5% Tb^{3+} doped Gd_2O_3 nanoparticles. Black and red experimental curves represent the nature of PL decays corresponding to λ_{em} = 490 nm and 545 nm, respectively	41
2.6	FTIR spectra of undoped and Tb^{3+} doped Gd_2O_3 samples	42
2.7	(a) Block diagram of hydrothermally synthesized Gd_2O_3 nanorods, (b) XRD patterns of as-synthesized $Gd(OH)_3$ product (pH 10·8) and Gd_2O_3 nanorods derived from precursors of different pH	43
2.8	(a) and (b) represent HRTEM images of nanorod samples synthesized at pH 10·8 and 13·3, respectively. Magnified image of an isolated Gd_2O_3 nanorod (derived from pH 10·8 precursor) with crystal lattice fringes depicted in (c). The SAED	46

	pattern is being highlighted in the inset of (c)	
2.9	A scheme of growth mechanism illustrating formation of Gd_2O_3 nanorods	47
2.10	Absorption spectra of Gd_2O_3 nanorods synthesized at different pH	47
2.11	Room temperature PL emission spectra λ_{ex} = 300 nm with deconvolution of Gd_2O_3 nanorods obtained from precursors at (a) pH 9·2, (b) pH 10·8 and (c) pH 13·3. a) PL excitation spectrum (λ_{em}= 480 nm) for pH=10.8 sample is shown in (d).	49
2.12	Thermogravimetric analysis of unsintered $Gd(OH)_3$ product (pH= 10·8)	50
2.13	(a) Raman spectra of Gd_2O_3 nanoparticles (GNP) and nanorods (GNR), (b) room temperature M~ H plot of the Gd_2O_3 nanorods synthesized at pH=10·8. Inset shows enlarged view of the plot near zero-field	52
2.14	Block diagram on various steps involved in the synthesis Gd_2O_3 nanorods	53
2.15	(a) XRD patterns of all the Gd_2O_3 samples, HRTEM images of Gd_2O_3 (b) seed nanoparticles, and nanorods synthesized at a processing temperature of (c) 140^oC, and (d) 180^oC. The feature shown in (d), characterize well developed nanorods with instances of hollow morphology. The SAED pattern is depicted in the inset of (d)	55
2.16	(a) Schematic growth mechanism of	58

Gd_2O_3 nanorods (upper panel) and a set of TEM images illustrating transformation of nanoparticle seeds to nanorods through oriented attachment (lower panel), (b) Arrhenius plot of the reaction constant *k* vs. inverse of temperature, T^{-1}

2.17 (a) PL emission spectra of different Gd_2O_3 samples: nanoparticles (GNP) (i), and hydrothermally processed nanorods (GNR) at a temperature of (ii) 140 ^oC and (iii) 180 ^oC. The deconvoluted PL curves of (b) GNP and (c) GNR systems are shown independently 60

2.18 Room temperature EPR spectra of the corresponding GNP and GNR systems 61

Chapter III

3.1 (a) XRD patterns of the (i) pristine and irradiated Gd_2O_3 nanorods at fluences of (ii) 1×10^{11}, (iii) 3×10^{11} and (iv) 1×10^{12} ions/cm^2. The HRTEM imaging of (b) pristine and irradiated (c) 1×10^{11}, (d) 3×10^{11}, (e) 1×10^{12} and (f) 3×10^{12} ions/cm^2 Gd_2O_3 nanorods. The histograms, shown as figure inset, represent size distribution of the nanorods 72

3.2 Tamarind-like shape evolution upon irradiation at a fluence of 1×10^{12} ions/cm^2 is depicted in (a), with regular deformation indicated by arrow marks for the case (b) 3×10^{12} ions/cm^2 , and (c) image on real look of mature tamarinds.(source:http://www.in.all.biz /img/in/catalog/23346.jpeg).The smooth and bumpy surface features can 74

	be visualized in magnified TEM images meant for the (d) un-irradiated nanorod and the one (e) irradiated at a fluence of 1×10^{12} ions/cm^2	
3.3	Raman spectra of a) pristine, and irradiated Gd_2O_3 nanorods at a fluence of b) 1x 10^{12} ions/cm^2, c) 3x 10^{12} ions/cm^2. Note the shifting of the prominent peak at very high fluence	76
3.4	(a) Variation of energy deposited per atom during irradiation vs. effective diameter of cylindrical zones created due to swift ion impact, (b) scheme illustrating shape evolution of Gd_2O_3 nanorods as a result of overlapping effect accompanied by impact of multiple ions	79
3.5	(a) A magnified view of an isolated nanorod with zoomed view of a segment highlighting lattice fringe and defects. The SAED pattern that highlights diffused diffraction rings is shown as inset of (a) at the bottom left. An EDX pattern illustrating elemental composition is depicted in Figure (b)	80
3.6	(a) PL spectra (λ_{ex} = 300 nm) of un-irradiated and irradiated Gd_2O_3 nanorod systems (i: 0, ii:1 × 10^{11}, iii: 3 × 10^{11}, iv: 1 × 10^{12} and v: 3 × 10^{12} ions/cm^2), and (b–f) deconvoluted PL spectra of the corresponding systems. Note the shadow areas under the curves representing mainly V_{Ox} and V_0^+ defects	81
3.7	First-derivative EPR absorption spectra of the un-irradiated and irradiated Gd_2O_3 nanorods (i: 0,ii: 1 × 10^{11}, iii: 3 × 10^{11}, iv: 1	82

	× 10^{12} and v: 3 × 10^{12} ions/cm^2) acquired at (a) 300 K and (b) 77 K	
3.8	(a) Curves of relative PL intensity (V_{Ox}/V_0^+) and τ_{ss} with ion fluence, (b) schematic representation of mediated spin distribution (d′>d), d being the inter-spin separation in case of un-irradiated nanorodsand d′ that for irradiated systems. The spin factor was calculated with pristine sample as reference. The response of the irradiated nanorods, in RT and LNT environments, are highlighted in (c) and (d), respectively.	84
Chapter IV		
4.1	(a) XRD patterns of undoped and Eu^{3+} doped $Gd_4O_3F_6$ nanosystems, (b) zoomed version of XRD patterns to highlight peak-shifting with Eu^{3+} doping	93
4.2	(a) HRTEM images of $Gd_4O_3F_6$ nanoparticles, and (b) 7% Eu3+ doped GOF sample (c) an isolated GOF nanoparticle depicting lattice fringe, (d) EDX patterns of (lower) undoped and (upper) 7% Eu^{3+} doped GOF specimens	93
4.3	(a) Optical absorption spectra of undoped and Eu^{3+} doped $Gd_4O_3F_6$ nanosystems, (b) corresponding first derivative spectra of the samples	95
4.6	(a) PL emission spectra of undoped and Eu^{3+} doped GOF samples. The schematic diagram on radiative transitions is illustrated in figure inset. The deconvoluted PL spectra of 3% Eu doped $Gd_4O_3F_6$ nanosystem is shown in (b)	96
Chapter IV	4.7 FTIR spectra of undoped and 7% Eu^{3+}	99

		doped $Gd_4O_3F_6$ nanosystems	
Chapter IV	4.8	(a) Raman spectra of un-doped and Eu^{3+} doped $Gd_4O_3F_6$ nanosystems, (b) deconvoluted Raman spectra of undoped and 7% Eu^{3+} doped GOF nanosystems	99
Chapter V			
	5.1	Distribution of colloidal particles (a) at equilibrium, (b) under shear, showing shear thinning and (c) shear thickening behaviour	107
	5.2	(a) shear stress vs. shear rate of pristine Gd_2O_3 (concentration 0.5 mg/mL) nanorods, (b) Apparent viscosity vs. shear rate curves for pristine MR fluid subjected to different magnetic fields	108
	5.3	Variation of shear stress vs. shear rate for different sample (a) Pristine (b) 1kGy and (c) 6 kGy samples and the corresponding variation of shear rate with viscosity shown in (d) ,(e) and (f)	109
	5.4	Schematic diagram of shear thickening and shear thinning feature	111
	5.5	(a), (b), (c), (d), (e) and (f) represents both shear thickening and shear thinning part of pristine, 1kGy and 6kGy samples	112
Chapter VI			
	6.1	(a) Effect of GNP and GNR treatment on the cell viability of PBMC. The digital photograph and membrane stability activity of nanoparticles and nanorods are highlighted in (b) and (c); respectively	122

6.2	Schematic representation of hemolysis activity	122
6.3	Histograms on (a) HepG2 and (b) MDA-MB-231 cell viability as measured by MTT assay with GNP and GNR loading	123
6.4	Optical microscopic images (scale bar: 100 µm) of MDA-MB-231 cells incubated without and with (a) GNP and (b) GNR treatment for 24h. Note the concentration dependent inhibition of cell growth	124
6.5	Apoptotic analysis of MDA-MB-231 cells after GNP and GNR treatment. Fluorescent images (scale bar: 100 µm)of AO/EB staining of (a) GNP and (b) GNR with different concentration of MDA-MB-231 cell lines. Colors in fluorescent images represent specific cells mentioned in the figure	125
