ABSTRACT	iii
References	vi
DECLARATION	ix
CERTIFICATE	xi
CERTIFICATE of EXTERNAL	xiii
ACKNOWLEDGMENT	xv
List of Figures	xxv
List of Tables	xxxii
List of abbreviations	xxxii
1 INTRODUCTION	1
1.1 Need for soil quality monitoring for sustainable agriculture	2
1.2 Techniques available for monitoring of soil quality parameter	3
1.2.1 Optical sensing techniques	3
1.2.2 Electrochemical sensing techniques	4
1.3 Problem statement of conventional techniques with reference to resource-limited environments and possible solutions	5
1.4 Evolution of smartphone technology and its penetration to human civilization	6
1.5 3D printing technology and its role for the development of phone based sensing and imaging system	9

1.6	Literature review- Utilization of common smartphone sensors in agricultural and environmental sensing applications	9
1.6.1	Smartphone camera based monitoring systems	10
1.6.2	Smartphone ALS based sensing systems	13
1.6.3	Smartphone accelerator and audio-jack based sensing platforms	16
1.7	Scope of the present thesis work	18
1.8	Aim of the thesis and its contribution	19
	References	22
2	Hardware and software part of smartphone for development of different sensing platform	31
2.1	Introduction	31
2.2	Integrated smartphone sensors and their functionalities	32
2.2.1	Use of integrated sensors and optical source of the smartphone for the development of different sensing systems	33
2.3	Software platforms for development of the sensing tool	38
2.4	Summary	40
	References	40
3	Smartphone based spectroscopic sensing for estimation of pH level and toxic metal ions in soil	43
3.1	Introduction	43
3.2	Design of smartphone-based spectrometric sensor for accurate estimation of pH value in Soil	45
3.2.1	Materials and methods	45
3.2.2	Preparation of the standard solutions and reagents	45
3.2.3	Soil sample collection and extraction procedure	45
3.2.4	Design of the sensing setup	46
3.2.5	Calibration of the device	47
3.2.6	Spectrometric based pH sensing using smartphone	50
3.2.7	Evaluation of different sensoristic parameters of the designed smartphone based photometric sensor	52
3.2.8	Sensor performance for different field collected samples	54
3.3	Extending the applicability of the designed smartphone-based spectrometer for the estimation of arsenic (As) and lead (Pb) ion concentrations in soil	56
3.3.1	Materials and methods	57
3.3.2	Chemicals and reagents	57
3.3.3	Instrumentation	57
3.3.4	Synthesis of the functionalized gold nanoparticles	57

3.3.5	Sample preparation	58
3.3.6	Design and calibration of the sensing setup	58
3.3.7	Development of the android application	59
3.3.8	Characterization of the nanoparticles	61
3.3.9	Mechanism for detection of As(III) and Pb(II) utilising AuNPs and Glucose as chemical sensor	61
3.3.10	Calibration of the designed smartphone sensing system for de- tection of As(III) and Pb(II)	66
3.3.11	Evaluation of sensoristic parameters of the designed sensor . .	68
3.3.12	Effect of interfering ions on the measurement of As(III) and Pb(II)	70
3.3.13	Evaluation of sensor performance for field-collected sample . .	70
3.4	Summary	73
	References	75
4	Colorimetric-based sensing for detection and quantification of phos- phate in water and soil on a mobile device	79
4.1	Introduction	79
4.1.1	Introduction to colorimetric technique	80
4.1.2	Realization of the need of a smartphone-based colorimetric device	81
4.2	Materials and methods	82
4.2.1	Sample preparation	82
4.2.2	In-field sample collection and extraction procedure	83
4.2.3	Spectrophotometric analysis of phosphate	83
4.2.4	Design of the smartphone-based sensing system	84
4.2.5	Android applications used for analysis	85
4.3	Calibration of the device	86
4.3.1	Android applications used for analysis	87
4.3.2	Performance evaluation of the sensor characteristics in pres- ence of interfering elements	90
4.3.3	Evaluation of sensing performance for field-collected samples .	91
4.4	Summary	93
	References	93
5	Smartphone platform photometric and fluorescence sensing for trace detection of nitrite in soil and water	97
5.1	Introduction	97
5.2	Working principle of the designed smartphone-based sensing system .	100
5.2.1	Design of the photometric sensor on the smartphone	100

5.2.2	Design of the fluorescence mode of sensing for the proposed sensor	100
5.3	Material and methods	101
5.3.1	Reagents and Chemicals	101
5.3.2	Instrumentation	101
5.3.3	Synthesis of the C-dots	101
5.3.4	Optimization of experimental conditions	102
5.3.5	Fabrication of the designed smartphone-based photometric sensing system	102
5.3.6	Fabrication of the designed smartphone-based fluorescence sensing system	103
5.3.7	Workflow of the android applications	104
5.4	Characterization of the synthesized C-dots	104
5.4.1	Transmission electron microscopes (TEM) imaging	104
5.4.2	Fourier transform infrared (FTIR) spectroscopy analysis	105
5.4.3	Condition and verification of occurrence of FRET	106
5.4.4	Mechanism of colorimetric and fluorescent response to nitrite	106
5.5	Dual-mode detection of nitrite by the designed smartphone sensing system	108
5.5.1	Photometric detection	108
5.5.2	Fluorescent detection	109
5.6	Sensor properties for both the specified sensing modalities	110
5.7	Effect of interfering elements on the sensor performance	111
5.8	Sensor performance evaluations for infield samples	112
5.9	Summary	114
	References	114
6	Accurate estimation of chlorophyll in tea leaves using a smartphone-based fluorescence sensor	121
6.1	Introduction	121
6.2	Materials and methods	123
6.2.1	Chlorophyll extraction procedure and preparation of standard chlorophyll samples	123
6.2.2	Fluorescence analysis of tea leaf chlorophyll samples	124
6.2.3	Design of the experimental sensing setup	125
6.2.4	Android applications workflow	126
6.2.5	Fluorescence based sensing of plant chlorophyll using smartphone	127
6.2.6	Smartphone based measurement and analysis	127
6.3	Evaluation of sensor parameters	129

6.4	Evaluation of the designed sensor for field collected samples	131
6.5	Summary	132
	References	134
7	Conclusions and future prospect of the thesis work	139
7.1	Conclusions	139
7.2	Limitations	141
7.3	Future prospects	142
